# **Population Projection of Districts in Slovakia until 2025**

**Bratislava, November 2004**

**Publication presents the projection of the population development of districts in Slovakia until 2025.**

## Introductions

**D**emographic projection is one of basic information considering the future development of society. Nowadays, when more and more decision authorities are being transferred to regions, the importance of regional demographic analyses and projections is growing.

Demographic development is regionally differentiated like other areas of social reproduction. It is influenced by different factors – from historical, through natural and cultural to social-economic ones. However, the basis of regional differences in population development is connected with its age structure, which creates conditions not only for reproductive processes but also for population migration. Present changes in the reproductive behaviour of population, which are being reflected on decreases in nuptiality, fertility, and abortion, low mortality decrease and also divorce increase and population ageing, are also of spatial character. Altogether, they are being spread from south-west to north-east and then project themselves also into the regional development with different intensity.

The Slovak Republic is known for its great regional differences. From a demographic point of view, Slovakia may be divided approximately into two significant regions – north and east with a progressive development and south and west with a regressive development. It is all about different types of reproductive and migration behaviour. The most evident tendency to new reproductive model is in Bratislava region, a little less evident one in other regions of western Slovakia and the most conservative regions are in the eastern Slovakia and Žilina region. This situation is being reflected in the age structure of population and also in all the parts of reproductive process.

The component method has been used for the computation of regional population projection until 2025. The starting data for the projection were the number and age structure of population in districts as of 31.12.2002. Each individual district has got projection scenarios, which were created as combinations of various variants of fertility, mortality, and migration development until 2025.

A complete age structure and basic demographic characteristics have been processed for each district and each year of the projection period. For reasons of many results there are only data for the last projection year (2025) in the publication. The complete projection results are at your disposal in the electronic form at the web site of Demographic research centre [www.infostat.sk/vdc](http://www.infostat.sk/vdc). Also the electronic version of this publication is at your disposal at the same Internet address.

## Assumptions of projection

Ten variants of fertility have been processed for the sake of population projection in the SR districts until 2025, 7 variants of both male mortality and female mortality, and 7 variants of migration. One of the basic theories during the projection preparation was the assumption that the regional demographic differentiation would not change significantly till the end of the projection period, i.e. present regional differences will be preserved at a great rate for now. The changes in regional demographic differentiation (especially as a result of the social development stabilization) are expected up to the end of the projection period, or over the horizon of this projection.

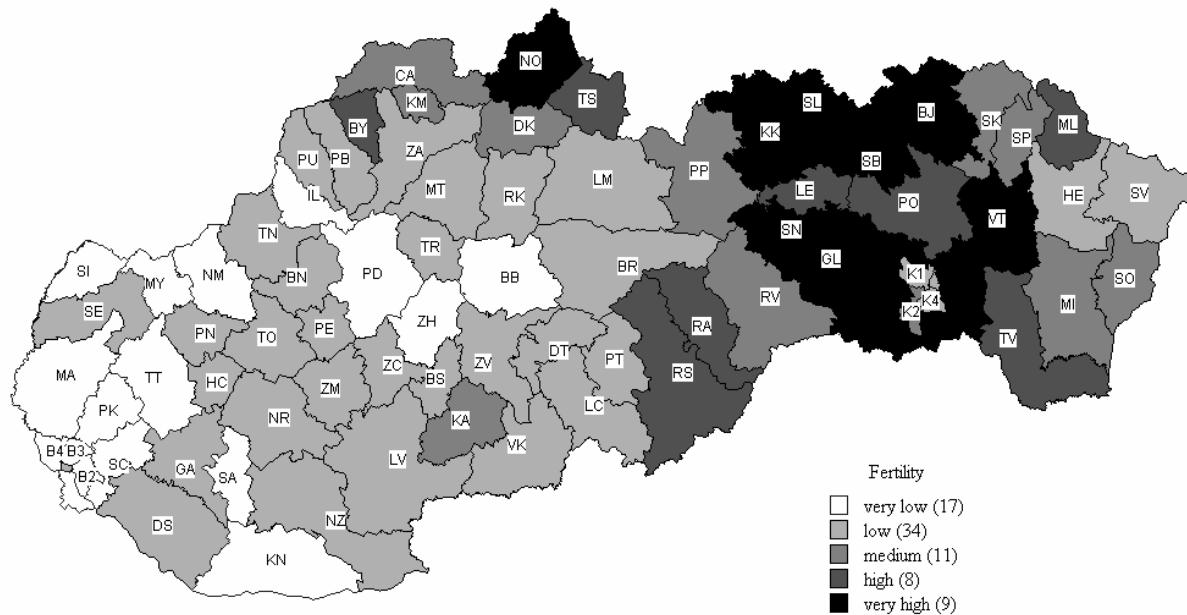

### *Fertility*

Low and higher growth rates have been applied for each of the five initial values that represent all the fertility range at the level of districts, which resulted in 10 variants of fertility development until 2025.

**Table 1 Variants of fertility development until 2025**

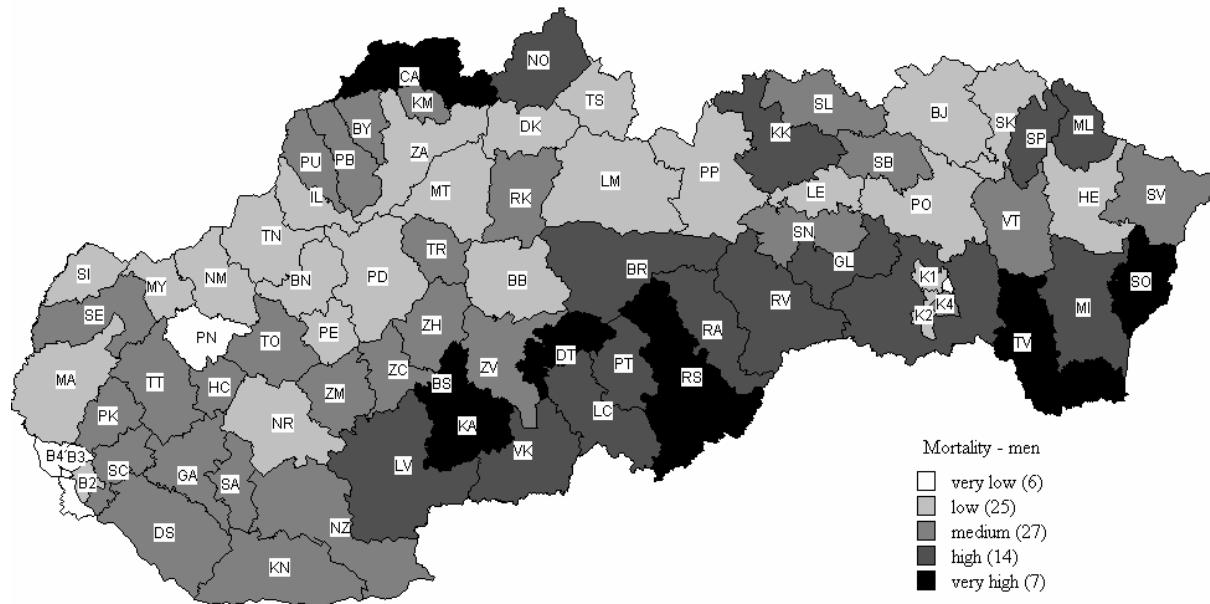

| Variants | Total fertility rate |      | Mean age at childbearing |      |
|----------|----------------------|------|--------------------------|------|
|          | 2003                 | 2025 | 2003                     | 2025 |
| 1        | 0,95                 | 1,15 | 27,4                     | 29,0 |
| 2        | 0,95                 | 1,25 | 27,4                     | 28,5 |
| 3        | 1,08                 | 1,25 | 27,1                     | 28,5 |
| 4        | 1,08                 | 1,45 | 27,1                     | 28,0 |
| 5        | 1,30                 | 1,45 | 26,2                     | 28,0 |
| 6        | 1,30                 | 1,60 | 26,2                     | 27,5 |
| 7        | 1,47                 | 1,60 | 26,1                     | 27,5 |
| 8        | 1,47                 | 1,80 | 26,1                     | 27,0 |
| 9        | 1,77                 | 1,80 | 26,0                     | 27,0 |
| 10       | 1,77                 | 2,00 | 26,0                     | 26,5 |

The highest fertility of the whole projection period is expected in the north of central Slovakia in Námestovo district, in four districts in the north-east of Slovakia (Kežmarok, Stará Ľubovňa, Sabinov, Bardejov), and in four districts in the east up to south-east (Spišská Nová Ves, Gelnica, Košice okolie, Vranov nad Topľou). The above-average fertility will persist also close to regions with the highest fertility. It is referred to Bytča and Tvrdošín districts in the north of central Slovakia and Levoča, Poprad, Medzilaborce, and Trebišov districts in the eastern Slovakia. Also two districts in the south of central Slovakia will fall into the group of districts with high fertility – Rimavská Sobota and Revúca. On the contrary, the lowest fertility is expected in Bratislava and its hinterland, then in the south of Slovakia (especially in Šaľa and Komárno districts), in three north-western districts (Skalica, Myjava, Nové Mesto nad Váhom), and in the area of four districts from Ilava to Banská Bystrica.

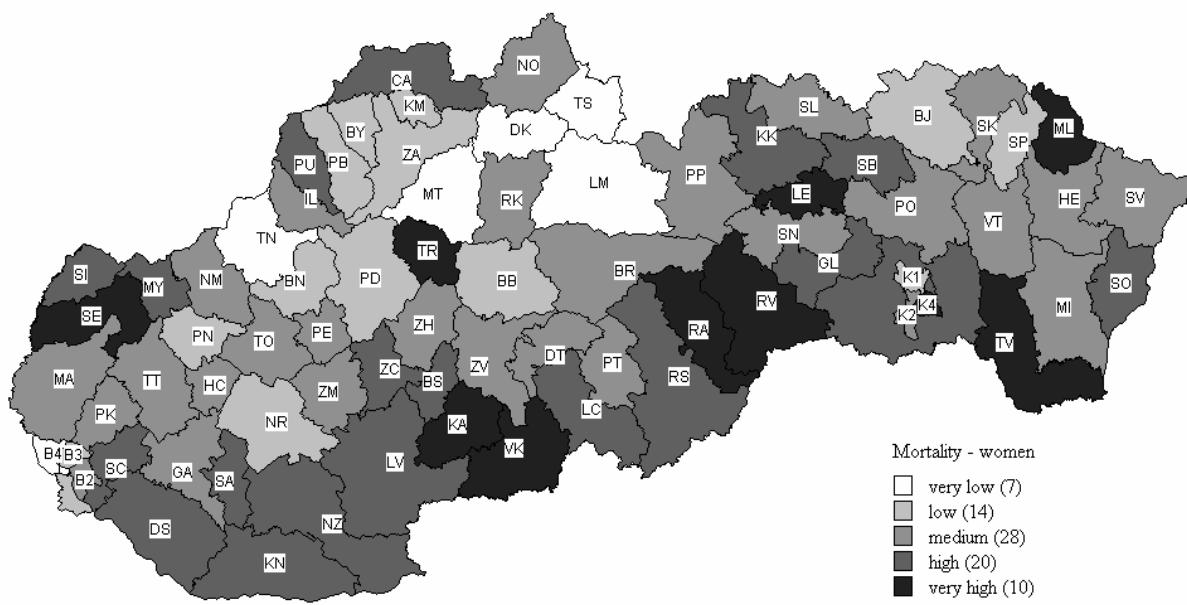

**Map 1 Variants of fertility development in the SR districts until 2025****Mortality****Table 2 Variants of mortality development until 2025**

| Variants | Life expectancy at birth - M |      | Life expectancy at birth - F |      |
|----------|------------------------------|------|------------------------------|------|
|          | 2003                         | 2025 | 2003                         | 2025 |
| 1        | 72,0                         | 77,0 | 79,0                         | 82,5 |
| 2        | 71,0                         | 76,0 | 78,5                         | 82,0 |
| 3        | 70,5                         | 75,5 | 78,0                         | 82,0 |
| 4        | 69,5                         | 74,5 | 77,5                         | 81,5 |
| 5        | 69,0                         | 74,0 | 77,0                         | 81,0 |
| 6        | 68,0                         | 73,0 | 76,5                         | 80,5 |
| 7        | 66,5                         | 72,0 | 76,0                         | 80,0 |

The zone of high male mortality is being spread in the south of Slovakia from Levice district up to Sobrance district. The group of districts with high male mortality contains also northern districts Čadca, Námestovo, Kežmarok, Stropkov, and Medzilaborce. The most favourable situation of male mortality is in Bratislava, Košice, and Piešťany district.

**Map 2 Variants of male mortality development in the SR districts until 2025**

The areas of the highest female mortality (similarly like male one) are located especially in the south of Slovakia. The zone of high female mortality starts directly eastward from Bratislava and ends at the Ukraine border in Sobrance district. The group with the highest female mortality contains also districts Senica, Turčianske Teplice, Levoča, and Medzilaborce. Apart from Bratislava, the second centre of low female mortality has been created in northern Považie (Trenčín, Martin, Liptovský Mikuláš districts) and in the neighbouring districts of Orava, Dolný Kubín, and Tvrdošín.

**Map 3 Variants of female mortality in the SR districts until 2025**

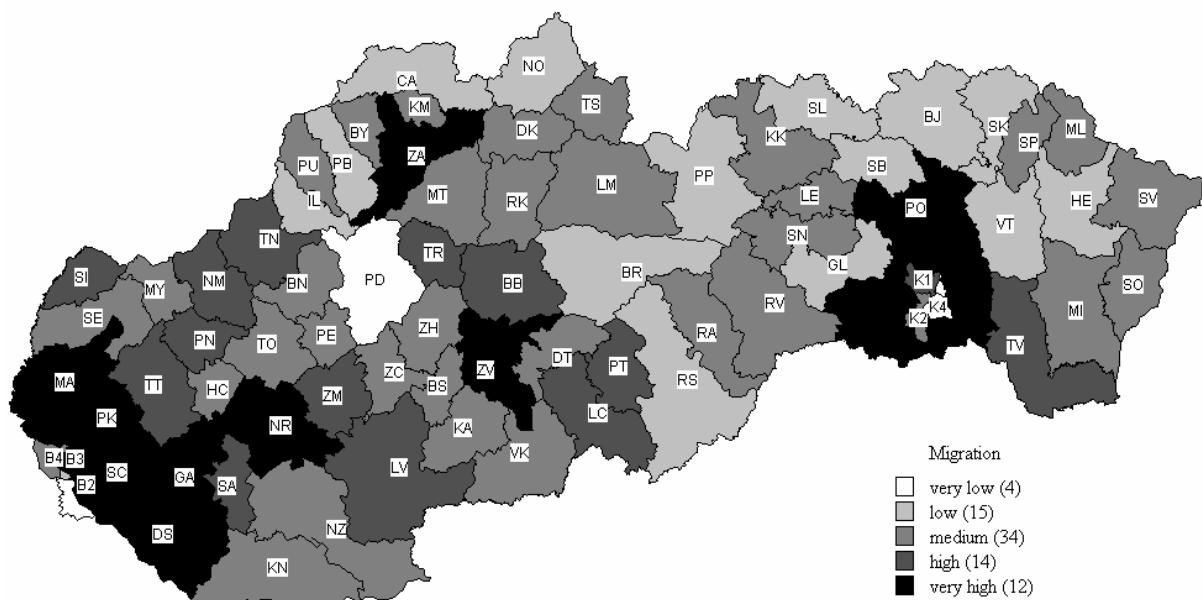

## Migration

**Table 3 Variants of migration development until 2025**

| Variants | Net migration |      |
|----------|---------------|------|
|          | 2003          | 2025 |
| 1        | -600          | -400 |
| 2        | -220          | -200 |
| 3        | -100          | -80  |
| 4        | 0             | 20   |
| 5        | 80            | 100  |
| 6        | 190           | 230  |
| 7        | 400           | 500  |

The highest population increases in migration are expected in the immediate hinterland of the two biggest Slovak cities, Bratislava and Košice. There is located also Nitra district increasing in migration in the wider hinterland of Bratislava and Prešov district in the wider hinterland of Košice also increasing in migration. Also Žilina and Zvolen districts will fall into the group with the highest migration increase. The highest negative net migration is expected in the cities of Bratislava and Košice and in Prievidza district. Also many districts in the north of central and eastern Slovakia will be decreasing in migration. The most of the SR districts have got migration suppressed and no more considerable change is expected in this respect until 2020. It means that migration increase, or decrease, will be moving around zero till the end of the projection period.

**Map 4 Variants of migration development in the SR districts until 2025**

## Scenarios of population development in districts

The combination of variants of fertility, mortality, and migration gave rise to the scenarios of population development until 2025. Each district has got one scenario, which looks like the most probable one for the relevant district nowadays.

| Num. | District             | Fertility | Mortality - M | Mortality - F | Migration |
|------|----------------------|-----------|---------------|---------------|-----------|
| 101  | Bratislava I         | 3         | 1             | 1             | 3         |
| 102  | Bratislava II        | 1         | 2             | 4             | 6         |
| 103  | Bratislava III       | 1         | 1             | 2             | 7         |
| 104  | Bratislava IV        | 1         | 1             | 1             | 4         |
| 105  | Bratislava V         | 1         | 1             | 2             | 1         |
| 106  | Malacky              | 2         | 3             | 5             | 7         |
| 107  | Pezinok              | 2         | 4             | 5             | 7         |
| 108  | Senec                | 2         | 5             | 6             | 7         |
| 201  | Dunajská Streda      | 3         | 5             | 6             | 7         |
| 202  | Galanta              | 3         | 5             | 5             | 6         |
| 203  | Hlohovec             | 4         | 4             | 4             | 4         |
| 204  | Piešťany             | 4         | 1             | 3             | 5         |
| 205  | Senica               | 4         | 5             | 7             | 4         |
| 206  | Skalica              | 2         | 3             | 6             | 5         |

## The number and structure of population in the SR districts until 2025

The different demographic development of particular regions in the SR will result in the different development of number and age structure of population in particular districts. On the whole, we may evaluate the expected changes in population number as not very significant. The population increase will be moving from -20% to +20% in 2003-2025. The population increases or decreases of up to 16 districts, will be close to zero (below 2%) over the whole projection period. The districts of which number of population will have fallen during the projection period are predominating over the districts with an expected population increase.

The highest population increases will be preserved in the hinterland of Bratislava, in the north of central Slovakia, and in the most of districts in the region of eastern Slovakia. Whereas increases in the hinterland of Bratislava will arise mainly due to migration, the population increase will result from the high fertility in central and eastern Slovakia. 12 districts will reach the population increase above 10% during the projection period. The highest increase in population (above 15%) is expected in the following districts: Košice okolie, Námestovo, and Kežmarok. The districts of Tvrdošín, Stará Ľubovňa, Pezinok, Spišská Nová Ves, and Senec with figures above 13% should immediately follow this trio of districts. The highest total population increase of Slovakia is expected in the district of Košice okolie. It is the only one of districts with high fertility in which also high migration increase is expected.

The highest population decreases are expected in southern Slovakia, then in the two biggest cities, Bratislava and Košice, in some districts near the Czech border, and in central Slovakia. Only the district of Bratislava I will probably achieve the population decrease at the limit of 20%; the decrease above 15% is expected in the district of Košice IV. The population decreases will be probably below the limit of 10% in other districts. The decrease will be going from 5% to 10% in 15 districts. In this group of districts, the highest population decreases should be in the districts of Komárno, Košice III, Myjava, Nové Zámky, Bratislava II, and Brezno. Medzilaborce district should be the only one with a significant decrease in the east of Slovakia.

**Map 5 Population increase in the SR districts over the period 2003-2025 (%)**

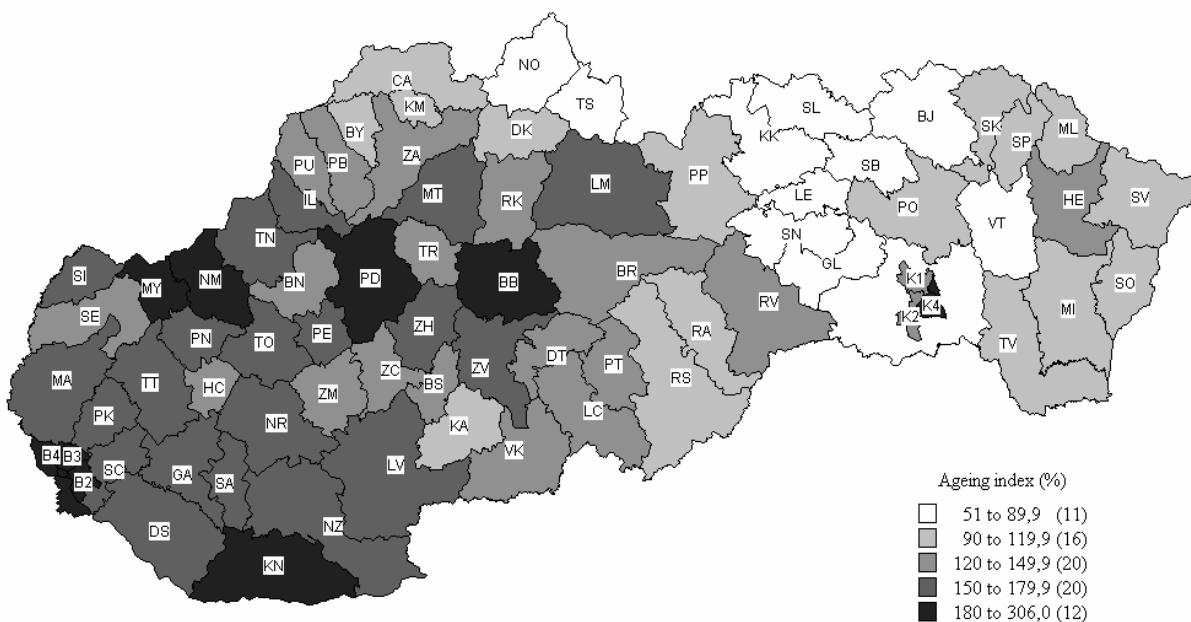

The changes in the age structure of population will be more significant than the changes in the number of population and their social importance will be higher. The process of population ageing will move forward in all districts with no exception, but it won't run equally. The growth of ageing index is expected from 20% to 165% in particular districts until 2025. An extreme growth of ageing index (more than 5 times) is expected in the districts of Bratislava V and Košice III. Also the difference between the districts with the highest ageing index and the lowest one shows the imbalanced population ageing in the SR. For example, the ageing index of Bratislava will be 6 times the figure of Námestovo district in 2025. It is largely possible to say that the population of districts with high fertility is younger, and conversely. The youngest population of Slovakia will be also in future in the north of central Slovakia and in eastern Slovakia. Some districts in the south of central Slovakia will also have relatively low ageing index (Revúca, Rimavská Sobota). The ageing index of 14 districts should be below 100% in 2025, i.e. the child population should be more frequent than the population at the age of 65 and over. This group contains also 3 northern districts of

Slovakia – Námestovo, Tvrdošín, and Čadca, apart from 11 districts in eastern Slovakia. The youngest population (the ageing index up to 60% in 2025) is expected in the districts of Námestovo, Kežmarok, Stará Ľubovňa, and Sabinov.

The districts with high ageing index are being spread in the whole south-western Slovakia and in a part of central Slovakia. The oldest population will be in 2025 in cities Bratislava and Košice. The ageing index will go over 200% in most of the districts in these two cities; it means that the number of population at the age of 65 and over will be more than 2 times when compared to the population below 15. The districts of Komárno, Banská Bystrica, Myjava, Nové Mesto nad Váhom, Prievidza, Nové Zámky, and Trnava follow Bratislava and Košice districts. The ageing index is expected from 150% to 200% in 2025 in 25 districts. There is no district of Prešov region or Košice region among them.

**Map 6 Ageing index in the SR districts in 2025**

## Conclusion

The projection confirmed the known fact that the SR is divided into the progressive north and east and the regressive south and west. Although the most of districts in Žilina, Prešov, and Košice regions achieve population increases almost over the whole projection period and the age structure remain relatively young in these regions, the districts of central, southern, and western Slovakia register mostly population decrease and their ageing process is more advanced.

In the near future no significant changes in the number of the SR population are expected and this is true also for most of districts. From the view of population increases, or decreases, the whole projection period may be in principle characterized as stagnation. The population increases will go down towards the end of the projection period, or they will change to decreases. The process of population decreases will gradually arrive to all the regions and majority of districts; it will accelerate and reach a peak far away from the horizon of this projection.
