## 1. Introduction

The demographic development significantly influences the functioning of society, thus, the study of demographic processes attracts a remarkable attention. The qualified decision-making in the field of economics, social affairs, employment, education, health and construction of dwellings cannot stand without skilled, appropriately structured, variant and flexible demographic information. The current societal situation increases the importance of demographic information, as the essential changes in the reproduction behaviour of population are also part of social changes. The changes in the increase and structure of population and in the structure of families and households are to be considered as the consequence of the above-mentioned changes. In addition to information on the historical and current population development, also the information on the expected development is necessary for decision-making processes. Demographic projections and forecasts are the basis when considering the future development of society.

Demographic forecasting is a very complicated activity, which requires suitable methodological tools for the calculation of projection and sufficient experience in formulation of developing scenarios and strategies. The knowledge on particular demographic processes and their joint impact on the development of population are also requisite.

For calculation of the SR's population projection until 2050 the component method has been used, which is the most commonly used method for long-term projections at the national level. This method is based on the principle of shifting of age groups, their reduction due to mortality, increase or decrease by the impact of migration and their supplementing by births according to the assumed intensity of fertility. The projection of population is thus a model of expected population development. It is based on the knowledge of the number of population and its structure by age and sex in the initial year of projection and on the estimation of basic reproductive factors and migration for the projection period.

Although in demographic processes the future is not automatically contained in the past, the recognition of the past and current population development is prerequisite for the creation of projection scenarios. Furthermore, when making a projection, the demographic theories as well as the situation in demographically advanced countries, whose development is with a certain delay partially copied by Slovakia, are also used.

The projection, which include in their assumptions the human behaviour and decision-making, are always accompanied with a great uncertainty. The same is true for demographic projections. Uncertainty in projections is growing with the length of the projection period and instability of the demographic and societal development at the time of construction of projection. This projection covers approximately the period of two generations what is the standard length at long-term projections. However, it has to be stressed, that it is being prepared in the time of societal and demographic transformation what is remarkably increasing the level of uncertainty, because the demographic trends are not yet stabilised. The uncertainty is most commonly expressed by the elaboration of several variants of projection. This projection has been elaborated in eight variants. The reason for calculation of higher number of variants is the effort to present the largest possible scale of possibilities of the future development. In addition to the likely variants, the projection contains also less likely (theoretical) variants, which document the population development under very specific conditions. Their importance is mainly illustrative; they allow better understanding of the functioning of demographic processes and they serve as a supplement to the basic (likely) variants.

The Annexes to this publication contain the main results of all eight variants of projection and complex results for the medium (the most likely) variant. The electronic version of this publication is to be found on the web site of Demographic Research Centre [www.infostat.sk/vdc](http://www.infostat.sk/vdc).

## 2. Assumptions of projection

The most important and most complicated part of demographic projection is the preparation of input parameters. As it has been mentioned in the introduction, demographic projections are marked by a large extent of uncertainty. The demand ness in this case is increased also by a long projection horizon and the transformation period underlying the Slovak society of nowadays. Thus, the expected development of input parameters is entered alternatively in several scenarios. The development of particular components of the population change (fertility, mortality and migration), which are at the same time the input parameters of projection being calculated by the component method, was for the

purposes of this projection elaborated in five scenarios (very low, low, medium, high, very high), while none of these parameters appears as totally unrealistic in terms of the current standpoint. The most likely development of fertility, mortality and migration is built in the medium scenario. It means, that we currently consider as a most likely scenario that one with the cease of the fertility decrease and its gradual increase to the levels of beginning of nineties of the 20<sup>th</sup> century, gradual decrease of mortality (until 2050, the increase in the life expectancy at birth to the levels, which are currently reached by the most advanced countries in the world) and with the step-by-step increase of net migration up to the level of 5000 people annually. The moderate deviations of input parameters from the most likely scenario are covered by the high and low scenario of input parameters. Based on current knowledge it can be assumed that the future development of fertility, mortality and migration should not exceed the limits stated by the high and low scenario. As mentioned earlier, neither the very low, nor the very high scenarios are totally unrealistic in terms of the current point of view and under certain specific circumstances such development should possibly occur. It is obviously possible that until 2050 such changes in trends might occur which cannot be expected now and until nowadays there are no indications that such changes should occur. Such development is not included in the input assumptions of this projection.

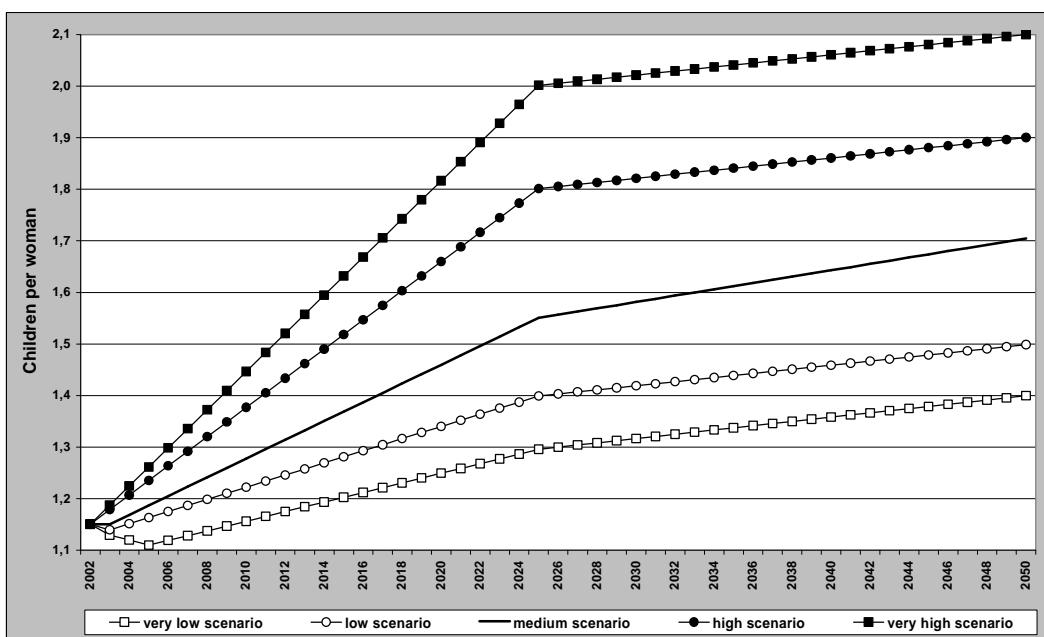

## 2.1 Fertility

The population development in demographically advanced countries is nowadays mostly influenced by fertility. The estimate of fertility development is thus the decisive component of the demographic projection. The basic assumption in all variants of this projection is the cease of the fertility decrease and its gradual increase (Table 1, Graph 1).

**Table 1 – Scenarios of fertility in the SR until 2050 (total fertility rate)**

Year	Scenario				
	very low	low	medium	high	very high
2005	1,110	1,164	1,186	1,235	1,261
2010	1,158	1,223	1,277	1,376	1,446
2015	1,205	1,282	1,368	1,517	1,630
2020	1,253	1,341	1,459	1,659	1,815
2025	1,300	1,400	1,550	1,800	2,000
2030	1,320	1,420	1,580	1,820	2,020
2035	1,340	1,440	1,610	1,840	2,040
2040	1,360	1,460	1,640	1,860	2,060
2045	1,380	1,480	1,670	1,880	2,080
2050	1,400	1,500	1,700	1,900	2,100

**Graph 1 – Scenarios of fertility in the SR until 2050**

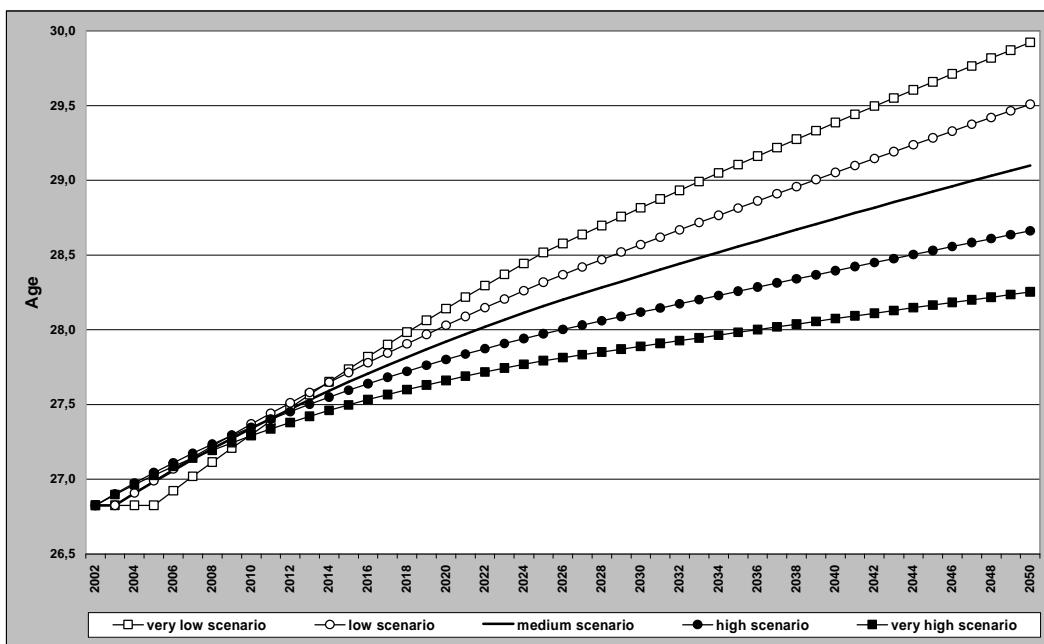

The particular scenarios differ in turning points and the consequent increase of fertility. In the very low scenario, the ongoing decrease of fertility until 2005 down to current lowest European levels is assumed. In the low and medium scenarios the cease of the fertility decrease in 2003 is assumed. According to the high and very high scenarios, the year 2002 should be the last year when the fertility would decrease. The individual scenarios of the fertility development differ mainly in fertility increase until 2050. The very low scenario assumes only small increase of fertility (until the end of the projection period the increase in total fertility rate by 8%, i.e. roughly to the levels from the end of nineties). The low scenario presupposes the gradual increase of fertility to the level of half of nineties of the 20<sup>th</sup> century; thus, to the level closely after the significant decrease of fertility from the first half of nineties. The high and very high scenarios expect the increase of fertility up to the levels from the beginning of nineties or the end of eighties. The medium scenario lies approximately in the middle between the high and low scenario and is approaching the expected fertility development in the majority of European countries. In this scenario the increase of total fertility rate until 2050 by 40%, to the level of 1.7, is assumed. In all scenarios the growth of fertility has a sharper course during the first half of the projection period. After 2025, the slowdown of the fertility growth is taken into consideration. In all scenarios, the increase of the mean age at childbirth is furthermore expected. The higher the fertility growth is, the lower is the postponement of births to the higher age, i.e. the lower is the increase of the mean age of mother at childbirth (Table 2, Graph 2).

**Table 2 – Mean age of women at birth in the SR until 2050**

Year	Scenario				
	very low	low	medium	high	very high
2005	26,83	26,99	26,99	27,04	27,03
2010	27,30	27,37	27,35	27,35	27,29
2015	27,74	27,71	27,66	27,60	27,50
2020	28,14	28,03	27,93	27,80	27,66
2025	28,52	28,32	28,16	27,97	27,79
2030	28,82	28,57	28,36	28,12	27,89
2035	29,11	28,81	28,55	28,26	27,98
2040	29,39	29,05	28,74	28,40	28,07
2045	29,66	29,28	28,92	28,53	28,16
2050	29,92	29,51	29,10	28,66	28,25

**Graph 2 – Average age of women at birth in the SR until 2050**

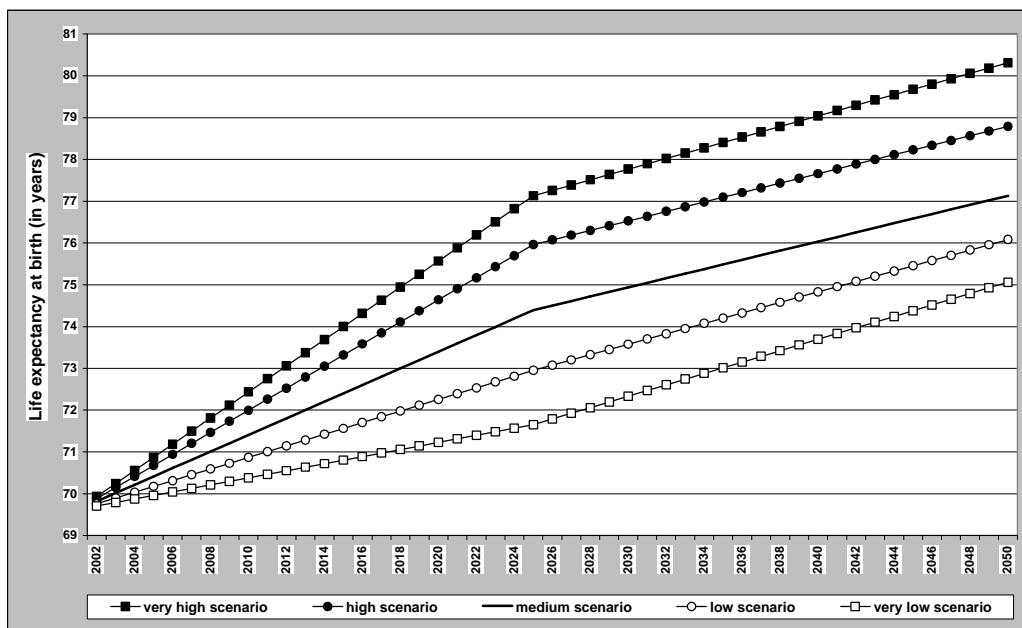

## 2.2 Mortality

It can be assumed that the unfavorable mortality development in Slovakia in the second half of 20<sup>th</sup> century generated a sufficient potential for the decrease of mortality during the course of the projection period. In all scenarios we suppose the decrease of mortality, which will appear at both genders by an increase of life expectancy at birth (Table 3 and 4, Graph 3 and 4).

**Table 3 – Scenarios of male mortality in the SR until 2050 (life expectancy at birth)**

Year	Scenario				
	very low	low	medium	high	very high
2005	69,96	70,18	70,42	70,68	70,87
2010	70,38	70,87	71,41	72,00	72,44
2015	70,80	71,56	72,40	73,32	74,00
2020	71,23	72,26	73,40	74,64	75,57
2025	71,65	72,95	74,39	75,96	77,13
2030	72,33	73,58	74,94	76,53	77,77
2035	73,01	74,20	75,49	77,09	78,40
2040	73,70	74,83	76,03	77,66	79,04
2045	74,38	75,45	76,58	78,22	79,67
2050	75,06	76,08	77,13	78,79	80,31

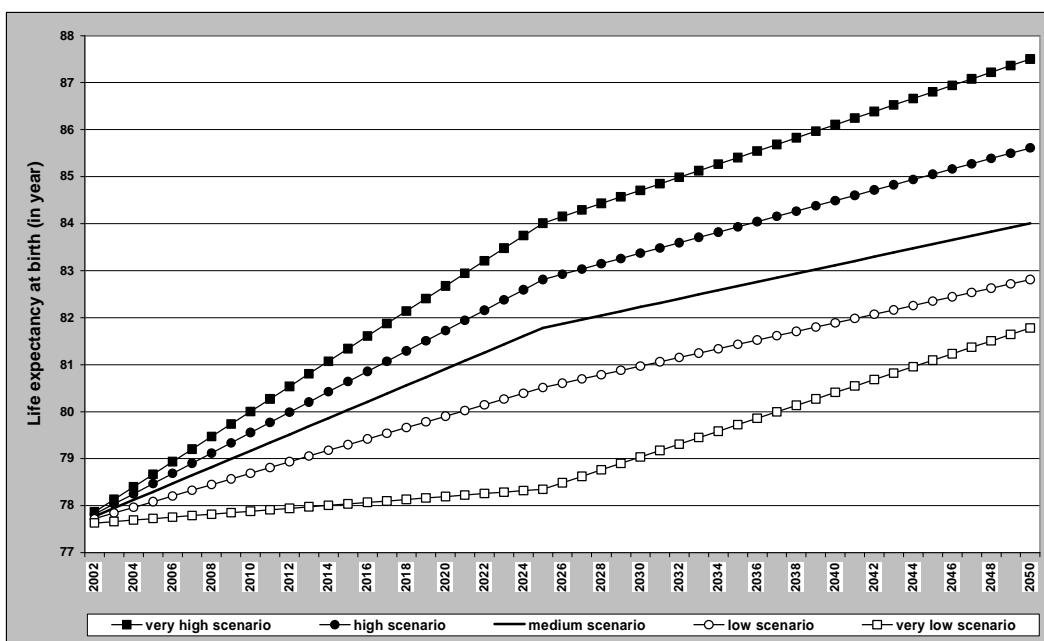

**Graph 3 – Scenarios of male mortality in the SR until 2050**

Until 2050, the medium scenario assumes the increase of life expectancy at birth in Slovakia up to level, which is currently reached by the most advanced countries. If the assumptions from the high or very high scenarios were fulfilled, for Slovakia it would likely mean a gradual decrease of the current quite high backwardness in mortality in comparison with the most advanced countries. On the contrary, the low and very low scenarios should most likely mean the deepening of current differences. If the mortality structure is concerned, in all five scenarios of the mortality development, the highest decrease in those age categories, in which the situation is less favorable and the backwardness behind the advanced countries is the biggest one, is assumed. Mainly men at the middle and older age and women at older age are in question. Only the small reduction in the difference in mortality of men and women is taken into account.

**Table 4 – Scenarios of female mortality in the SR until 2050 (life expectancy at birth)**

Year	Scenario				
	very low	low	medium	high	very high
2005	77,73	78,09	78,30	78,47	78,67
2010	77,88	78,69	79,17	79,55	80,00
2015	78,04	79,30	80,04	80,64	81,34
2020	78,19	79,90	80,91	81,72	82,67
2025	78,35	80,51	81,78	82,81	84,01
2030	79,04	80,97	82,23	83,37	84,71
2035	79,72	81,43	82,67	83,93	85,41
2040	80,41	81,89	83,12	84,49	86,10
2045	81,09	82,35	83,56	85,05	86,80
2050	81,78	82,81	84,01	85,61	87,50

**Graph 4 – Scenarios of female mortality in the SR until 2050**

## 2.3 Migration

The problem when estimating migration lies mainly in the fact that it is influenced by non-demographic factors (more than fertility and mortality). In addition, the development of migration in Slovakia will to a great extent depend on the course of integration processes in Europe and on the migration situation in the world. Nevertheless, the migration of population from less advanced countries to more advanced countries is a worldwide trend, which will not miss Slovakia as well. It can be assumed that the net migration of the Slovak Republic will be in future influenced mainly by a population group (inhabitants of the SR) who will seek self-assertion in advanced countries and the group of immigrants from developing countries. In case of emigrants, most likely the young and educated people will be in question. In case of immigrants, almost only people from Eastern Europe and developing countries will be in question. It can be assumed that the favorable the situation in Slovakia will be, the higher the standard of living will be, the fewer inhabitants will leave and the more foreigners will be interested in immigration to Slovakia. In the future, the effort of government in influencing the migration processes can also be expected, depending on the concrete situation.

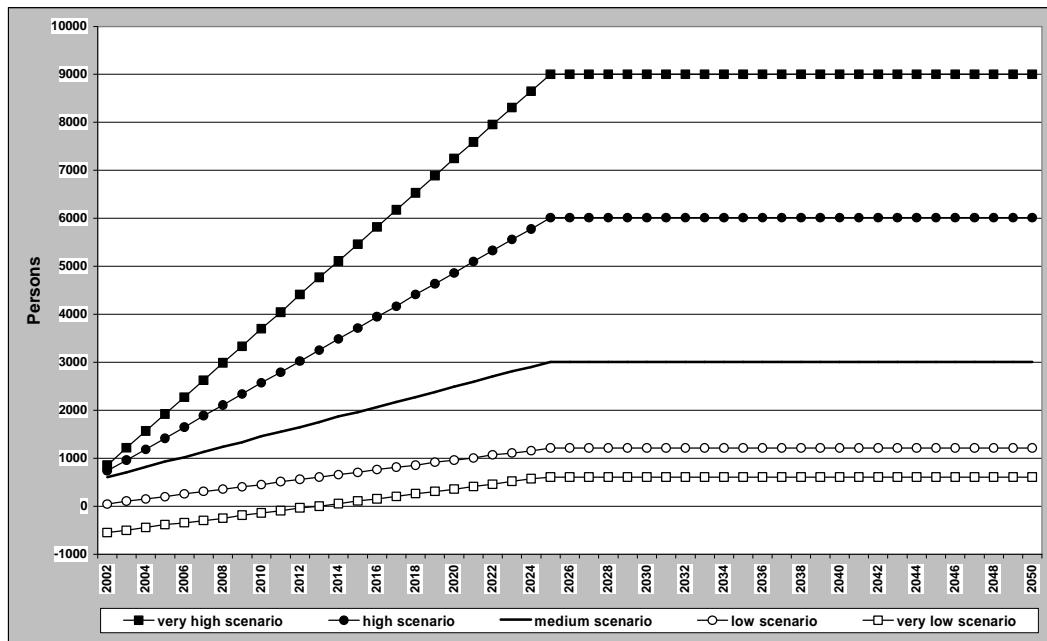

In all scenarios of the migration development we suppose the gradual increase of the migration gain up to 2025 and the consequent maintaining of this level up to the end of the projection period (Table 5 and 6, Graph 6 and 6). The different level in increase of net migration corresponds to

the different scenarios of the integration process in Europe and to the increase of standard of living in Slovakia.

**Table 5 – Scenarios of male migrationin the SR until 2050 (net migration)**

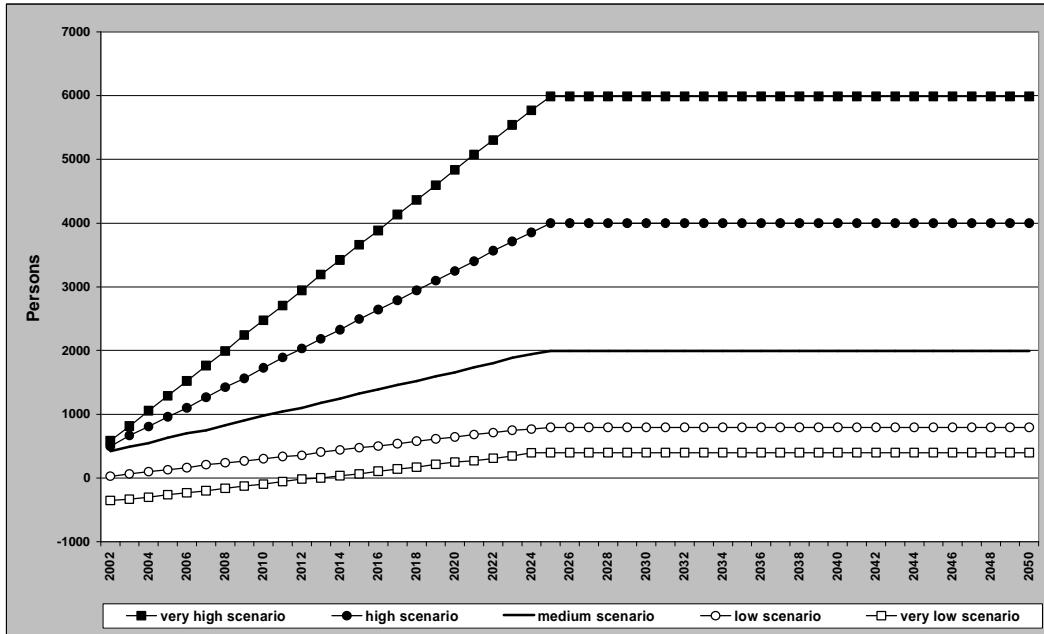

Year	Scenario				
	very low	low	medium	high	very high
2005	-387	195	927	1 413	1 920
2010	-142	448	1 460	2 569	3 698
2015	108	704	1 954	3 713	5 462
2020	353	960	2 496	4 859	7 244
2025	600	1 200	3 000	6 000	9 000
2030	600	1 200	3 000	6 000	9 000
2035	600	1 200	3 000	6 000	9 000
2040	600	1 200	3 000	6 000	9 000
2045	600	1 200	3 000	6 000	9 000
2050	600	1 200	3 000	6 000	9 000

**Graph 5 – Scenarios of male migration in the SR until 2050**

**Table 6 – Scenarios of female migrationin the SR until 2050 (net migration)**

Year	Scenario				
	very low	low	medium	high	very high
2005	-262	131	634	961	1 289
2010	-97	303	979	1 727	2 475
2015	66	477	1 325	2 494	3 659
2020	250	643	1 658	3 247	4 835
2025	400	800	1 993	4 000	6 000
2030	400	800	2 000	4 000	6 000
2035	400	800	2 000	4 000	6 000
2040	400	800	2 000	4 000	6 000
2045	400	800	2 000	4 000	6 000
2050	400	800	2 000	4 000	6 000

**Graph 6 – Scenarios of female migration in the SR until 2050**

### 3. Alternative scenarios of the population development in the SR

By the combination of input parameters we receive the projection scenarios. For the purposes of this projection, we have elaborated eight scenarios, which represent more or less likely versions of the future development (Table 7). Because the input parameters do not contain any unrealistic variants, the particular projection scenarios could be marked as realistic possibilities of the future population development (of course not with the same probability). The only exception is the scenario without migration, which is of a pure theoretical nature.

**Table 7 – Overview of variants of projection**

Variant of projection	Scenario				
	Mortality males	Mortality females	Fertility	Migration males	Migration females
Baseline	Medium	Medium	Medium	Medium	Medium
Very high	Very low	Very low	Very high	Very high	Very high
High	Low	Low	High	High	High
Low	High	High	Low	Low	Low
Very low	Very high	Very high	Very low	Very low	Very low
Young	High	High	High	High	High
Old	Low	Low	Low	Low	Low
Without migration	Medium	Medium	Medium	0	0

The baseline scenario (medium fertility, medium mortality, medium migration) is to be considered as the most likely variant of the future population development. Together with the high scenario (high fertility, low mortality, high migration), the low scenario (low fertility, high mortality, low migration), the young scenario (high fertility, high mortality and high migration) and the old scenario (low fertility, low mortality, low migration) it can be classified into the group of more likely scenarios. It means that based on current knowledge the future development of the number and structure of population should be in the range between the high and low scenario, most likely closely to the baseline scenario.

Other scenarios can be marked as less likely, however still realistic, variants of the future population development. This group covers the very high scenario (very high fertility, very low mortality, very high migration) and the very low scenario (very low fertility, very high mortality, very

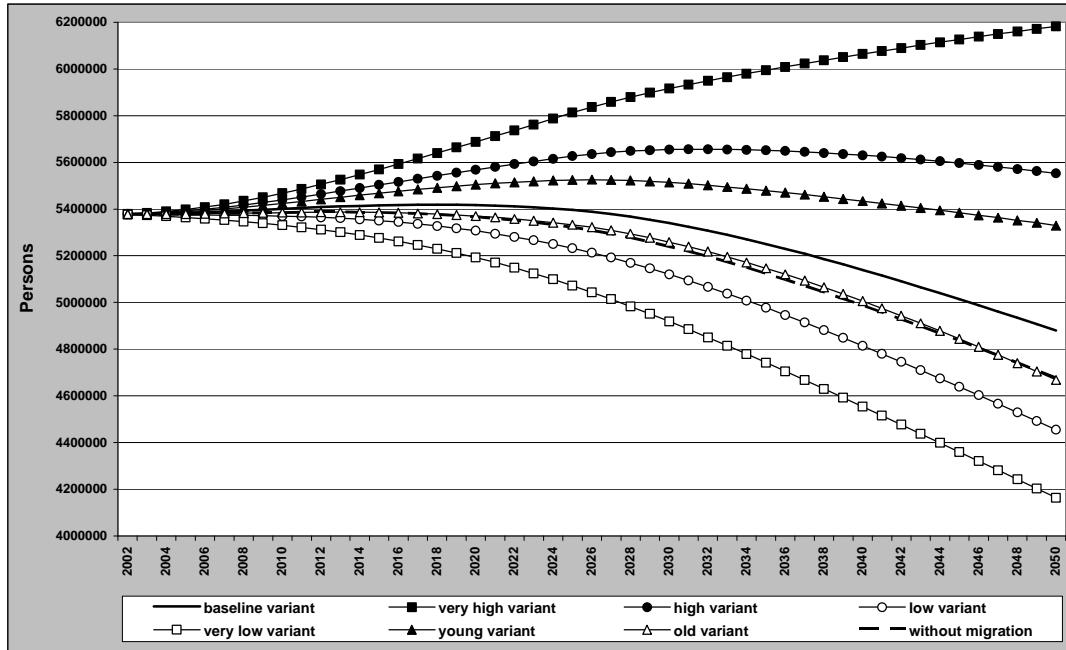

low migration). These scenarios are owing to our current standpoint less likely, however, under some specific conditions they might occur.

The scenario without migration is only a theoretical version, which cannot appear in practise, however it is justifiable. It shows separately the impact of the natural reproduction and migration on the development of number and structure of population.

#### 4. Development of the number and structure of population in the SR until 2050

The decrease in the number of population will be one of the basic characteristic features of the future demographic development in Slovakia (Graph 7). The question is, when this decrease will start and what intensity it will have. The answer to this question is provided by particular variants of projection, which document the different development of the number of population and circumstances, under which such a development might occur. Only within the very high variant, the increase in the number of population during the course of the projection period is expected. After the initial increase in the number of population (approximately until 2030), the high and young variant record, a decrease roughly to the current values or the values slightly higher. Other variants assume until 2050 a reduction in the number of population (as compared to the initial point of the projection, by 10% up to 23%). Within the low and old variant and in the variant without migration, after stagnation approximately until 2020, the number of population will decrease remarkably, i.e. below the boundary of 5 million people. In the very low variant the decrease in the number of population is the highest. It starts immediately in the beginning of the projection period and the number of population according to this variant should decrease until 2050 even closely above the boundary of 4 million people. The development of the number of population in the most likely variant can also be marked as stagnation in the first half of the projection period. The decrease until the end of the projection period should be less sharp as in the case of other variants, which expect the decrease in the number of population of the SR. Also according to the most likely variant, the number of population of the SR should decrease below the boundary of 5 million people.

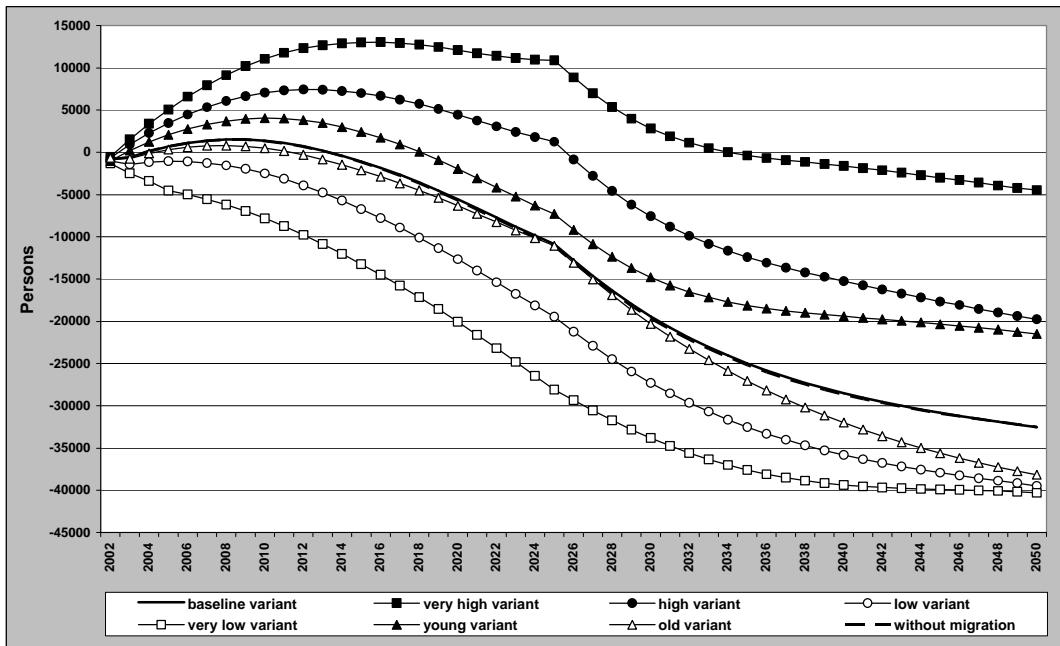

**Graph 7 – Population in Slovakia until 2050**

Natural increase should grow approximately until 2010. Only very low and low variant assume the decline of natural increase immediately since the beginning of the projection period. In these two variants practically immediately since 2002 the natural decrease is in question. The growth or the stagnation of natural increase in other variants is gradually changing to a decline (in baseline variant around the year 2010, at the latest in the very high variant around the year 2025). This decline will persist until the end of projection period. The decline of natural increase will accelerate mainly during 2025-2040. At the end of the projection period, the decline of natural increase of population will

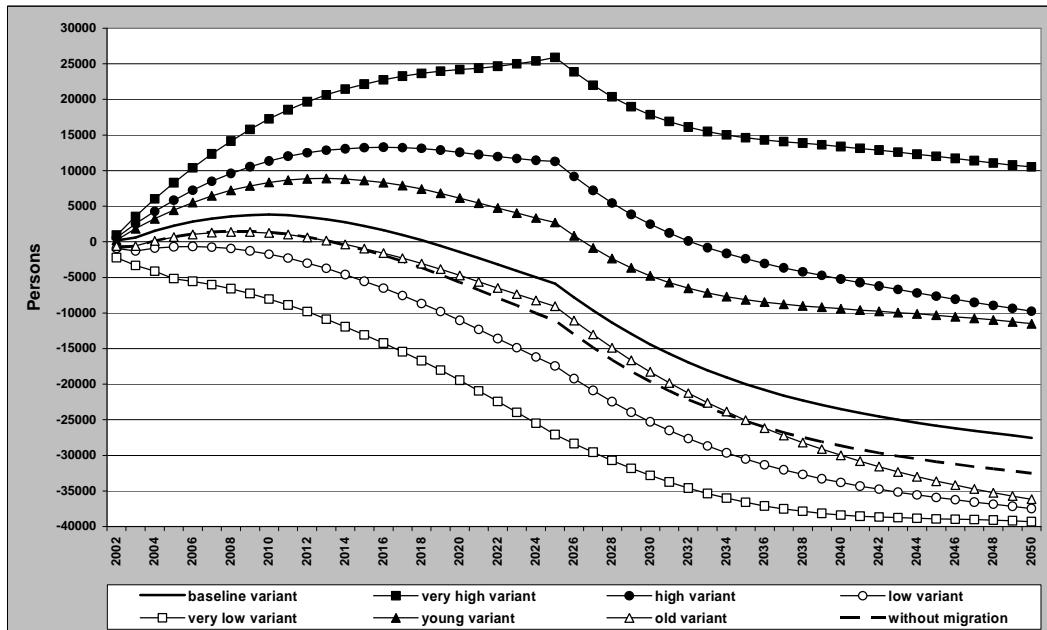

significantly slow down. In none of these variants we suppose the natural increase of population at the end of the projection period. In the most optimistic case, the natural increase will oscillate around the level of 5 thousand people annually. In the most pessimistic case, the natural decrease of population in Slovakia would be almost 40 thousand people annually (Graph 8).

**Graph 8 – Natural increase in Slovakia until 2050**

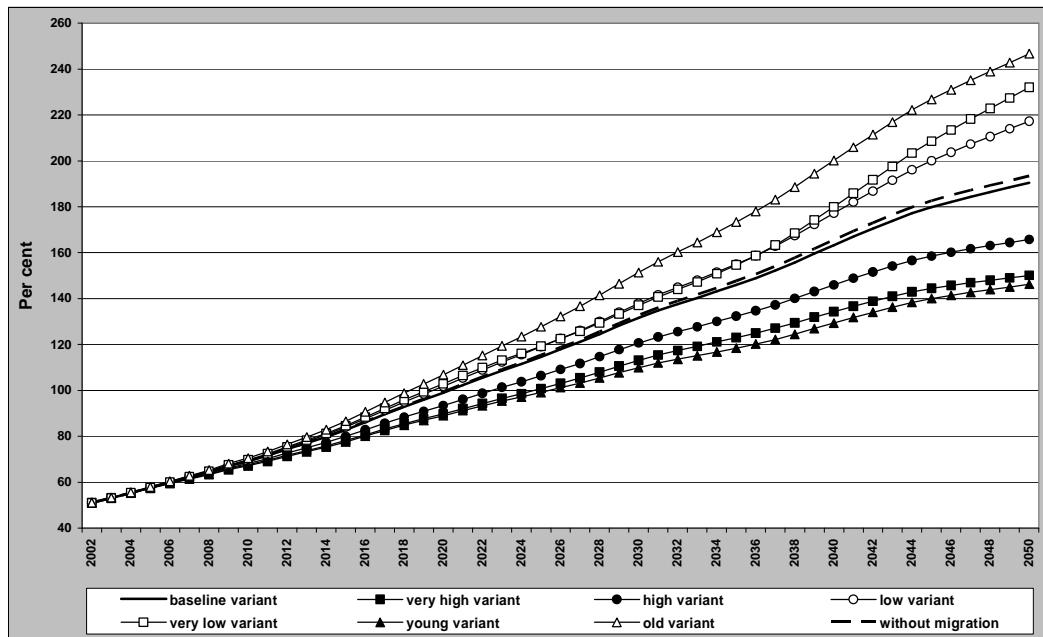

Due to the fact that in all variants of projection it has been assumed the positive net migration, the development of total increase of population is more favorable as the development of natural increase. Only according to the very high variant, the increase of population will be maintained during the course of the whole projection period. All other variants take the decrease of population in 2050 into consideration, which should be in the range of 10 – 40 thousand people annually. In the high and young variants the starting point of the decline of population increase is estimated in 2015 and the decrease of population should start closely after 2030. The baseline and old variant, as well as the variant without migration, suppose the turning point in the development of total increase of population around the year 2010 and with the population decrease already before the year 2020. In low and very low variants we suppose with the decrease of population during the course of the whole projection period (Graph 9).

**Graph 9 – Total increase in Slovakia until 2050**

The ageing of population will be beside the decrease of population the second most important feature of the future population development in Slovakia. According to its importance, it is unambiguously the most remarkable consequence of the current population development. As it is evidenced by the ageing index<sup>1</sup> (Graph 10), ageing will accelerate in all variants of projection. The growth is obviously higher in those variants, which assume the weaker reproduction of population (the low, very low and old variant). In the old variant, the 4.8 times higher increase of the ageing index is assumed until 2050, in the baseline variant 3.7 times higher increase and in the very high variant the ageing index will raise three times more. In other words, while currently two inhabitants aged 17 years and less fall per 1 inhabitant aged 65 years and over, in 2050 this ratio will be, according to the baseline variant, nearly precisely opposite. Nearly two inhabitants aged 65 years and over will fall per one inhabitant aged 17 years and less.

**Graph 10 – Ageing index in Slovakia until 2050**

## 5. Conclusion

Main features in the population development of the SR in the first half of 21<sup>st</sup> century will be the decline of the population increase and ageing. The intensity of these processes will directly depend on the development of fertility, mortality and migration, however, indirectly it will be influenced also by other demographic factors, as well as by social, political, economic, cultural and many other factors.

It is very likely that the population increase will stagnate for some time. Only the increase of fertility to the replacement level and the positive net migration at the level at least 10 thousand people annually would allow maintaining of moderate population increase until the end of the projection period. Such development is, however, very unlikely. It can be assumed, that during 15-20 years at the latest, the period of a persistent decrease of population will start, which will cease most likely at the end of century. Today it is very hard to say at which level, but as we see it nowadays, the decrease of the number of population of the SR down to the level of 4 million people until 2100 seems to be possible. During the forthcoming decades the ageing of population will accelerate. It is the consequence of the decrease in births and the increase of life expectancy. It is a process, which is in the horizon of this projection considered as irrevocable, it cannot be ceased, only alleviated. Population ageing is the most significant consequence of the current demographic development.

The expected demographic development will bring several remarkable changes in question. The society has to be prepared for the increase of the share of older and old people, integration of a

<sup>1</sup> Population aged 65 and over per 100 population aged 0 - 17

higher number of foreigners (often from very different cultures) and the increased tension in the inter-generation relations. To cope with the situation, the new approaches in the population, family, social, economic and migration policies will be required. Our advantage is that we are very well aware of the problems we shall be faced with. Furthermore, the time delay, in which these problems will come to Slovakia, allows us to trace how the countries, in which these processes are much more ongoing, deal with this situation. Thus, we have more time for seeking optimal solutions for our country. Nevertheless, such measures have to be adopted in advance, which will alleviate the expected unfavorable impacts on the society and population. The efficiency of population measures is a long-term matter. Thus, their application should start in advance. Furthermore, all measures have to be prepared and carried out with the clear aim and in mutual links.

# **Appendix 1**

## **Main results of projection**

**Table 8 – Main results of projection (baseline variant)**

Year	Population	Natural increase	Total increase	Ageing index	Mean age
2005	5 383 521	706	2 267	57,68	37,63
2010	5 400 780	1 385	3 824	69,22	39,12
2015	5 416 032	-1 087	2 192	82,86	40,49
2020	5 416 888	-5 562	-1 408	99,06	41,85
2025	5 396 429	-10 863	-5 864	114,69	43,28
2030	5 340 250	-19 407	-14 408	131,64	44,68
